

JIM HOAGLAND

Contributing Editor, *The Washington Post*

I would like to start this final session of the day by thanking the audience for staying and congratulating you, because I think you are in for one of the most relevant sessions you will hear during the three days of the conference. I am quite excited by this panel, because it is going to suggest practical applications for what you have been hearing here and elsewhere, about Artificial Intelligence and interconnectivity. I am excited about this, because we have a panel of practitioners, people who are really involved in the industry of the Internet of Cars, the Internet of Airborne Vehicles, and the Internet of Space and Space Communications. We have a panel who will be discussing the way you live and things that you do in everyday life, and I guarantee that when they have finished, you will understand much better what the future holds for you, and the fact that the future is now.
